- 1. One of the most closely guarded secrets of Soviet medical research was the development of an "associate vaccine" by the Scientific Research Institute of Sanitary Inspection [HHHCN] in Moscow.

50X1

The vaccine is supposed to render immunity and develop antigens in the body against six types of diseases, namely, typhoid polyvalent (typhoid A & B), abdominal typhoid, dysentery, cholera, and tetanus. The associate vaccine is prepared centrally in Moscow, principally for the Soviet army. it renders immunity for one year and must be followed by annual booster shots. did not learn any technical details concerning its preparation, or who the scientists were who developed it; however, it was the complex work of several men. The only other fact about the vaccine was that the results obtained were good and that it had been well received by the Soviet army. it would be entirely possible to develop this type of vaccine if the solution is buffered sufficiently to keep the particles from agglutinating.
